Technical Supplement

MC68HC812A4 Electrical Characteristics

The MC68HC812A4 microcontroller unit (MCU) is a 16-bit device composed of standard on-chip peripheral modules connected by an intermodule bus. Modules include a 16-bit central processing unit (CPU12), a Lite integration module (LIM), two asynchronous serial communications interfaces (SCI0 and SCI1), a serial peripheral interface (SPI), a timer and pulse accumulation module, an 8-bit analog-to-digital converter (ATD), 1-Kbyte RAM, 4-Kbyte EEPROM, and memory expansion logic with chip selects, key wakeup ports, and a phase-locked loop (PLL).

This supplement contains the most accurate electrical information for the MC68HC812A4 microcontroller available at the time of publication. The information should be considered preliminary and is subject to change. The following characteristics are contained in this document:

Table 1 Maximum Ratings¹

Rating	Symbol	Value	Unit
Supply voltage	V_{DD}, V_{DDA}, V_{DDX}	-0.3 to +6.5	V
Input voltage	V_{IN}	-0.3 to +6.5	V
Operating temperature range ² MC68HC812A4PV8 MC68HC812A4CPV8 MC68HC812A4VPV8 MC68HC812A4MPV8	T_A	T_L to T_H 0 to +70 -40 to +85 -40 to +105 -40 to +125	°C
Storage temperature range	T_{stg}	-55 to +150	°C
Current drain per pin ³ Excluding V_{DD} and V_{SS}	I_{IN}	± 25	mA
V_{DD} differential voltage	$V_{DD}-V_{DDX}$	6.5	V

NOTES:

1. Permanent damage can occur if maximum ratings are exceeded. Exposures to voltages or currents in excess of recommended values affects device reliability. Device modules may not operate normally while being exposed to electrical extremes.
2. Refer to MC68HC812A4TS/D Technical Summary for complete part numbers.
3. One pin at a time, observing maximum power dissipation limits. Internal circuitry protects the inputs against damage caused by high static voltages or electric fields; however, normal precautions are necessary to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Extended operation at the maximum ratings can adversely affect device reliability. Tying unused inputs to an appropriate logic voltage level (either GND or V_{DD}) enhances reliability of operation.

Table 2 Thermal Characteristics

Characteristic	Symbol	Value	Unit
Average junction temperature	T_J	$T_A + (P_D \times \Theta_{JA})$	°C
Ambient temperature	T_A	User-determined	°C
Package thermal resistance (junction-to-ambient) 112-pin thin quad flat pack (TQFP)	Θ_{JA}	39	°C/W
Total power dissipation ¹	P_D	$P_{INT} + P_{I/O}$ or K $\overline{T_J + 273°C}$	W
Device internal power dissipation	P_{INT}	$I_{DD} \times V_{DD}$	W
I/O pin power dissipation ²	$P_{I/O}$	User-determined	W
A constant ³	K	$P_D \times (T_A + 273°C) + \Theta_{JA} \times P_D^2$	W · °C

NOTES:

1. This is an approximate value, neglecting $P_{I/O}$.
2. For most applications $P_{I/O} \ll P_{INT}$ and can be neglected.
3. K is a constant pertaining to the device. Solve for K with a known T_A and a measured P_D (at equilibrium). Use this value of K to solve for P_D and T_J iteratively for any value of T_A .

NOTES:

1. Specification is for parts in the -40 to $+85^\circ\text{C}$ range. Higher temperature ranges will result in increased current leakage.

Table 6 ATD DC Electrical Characteristics

$V_{DD} = 5.0$ Vdc $\pm 10\%$, $V_{SS} = 0$ Vdc, $T_A = T_L$ to T_H , ATD Clock = 2 MHz, unless otherwise noted

Characteristic	Symbol	Min	Max	Unit
Analog supply voltage	V_{DDA}	4.5	5.5	V
Analog supply current Normal operation	I_{DDA}		1.0	mA
Reference voltage, low	V_{RL}	V_{SSA}	$V_{DDA}/2$	V

Reference supply current	I_{REF}		250	μ A
Input capacitance Not Sampling Sampling	C_{INN} C_{INS}		10 15	pF pF

NOTES:

1. Accuracy is guaranteed at $V_{RH} - V_{RL} = 5.0V \pm 10\%$.
2. To obtain full-scale, full-range results, $V_{SSA} \leq V_{RL} \leq V_{INDC} \leq V_{RH} \leq V_{DDA}$.
3. Maximum leakage occurs at maximum operating temperature. Current decreases by approximately one-half for each 10°C decrease from maximum temperature.

Table 7 Analog Converter Characteristics (Operating)

$V_{DD} = 5.0$ Vdc $\pm 10\%$, $V_{SS} = 0$ Vdc, $T_A = T_L$ to T_H , ATD Clock = 2 MHz, unless otherwise noted

Characteristic	Symbol	Min	Typical	Max	Unit
8-bit resolution ¹	1 count		20		mV
Differential non-linearity ²	DNL	-0.5		+0.5	count
Integral non-linearity ²	INL	-1		+1	count
Absolute error ^{2,3} 2, 4, 8, and 16 ATD sample clocks	AE	-1		+1	count
Maximum source impedance	R_S		20	See note ⁴	$\text{k}\Omega$

NOTES:

1. $V_{RH} - V_{RL} \geq 5.12V$; $V_{DDA} - V_{SSA} = 5.12V$
 2. At $V_{REF} = 5.12V$, one 8-bit count = 20 mV.
 3. Eight-bit absolute error of 1 count (20 mV) includes 1/2 count (10 mV) inherent quantization error and 1/2 count (10 mV) circuit (differential, integral, and offset) error.
 4. Maximum source impedance is application-dependent. Error resulting from pin leakage depends on junction leakage into the pin and on leakage due to charge-sharing with internal capacitance.
- Error from junction leakage is a function of external source impedance and input leakage current. Expected error in result value due to junction leakage is expressed in voltage (V_{ERRJ}):

$$V_{ERRJ} = R_S \times I_{OFF}$$

where I_{OFF} is a function of operating temperature. Charge-sharing effects with internal capacitors are a function of ATD clock speed, the number of channels being scanned, and source impedance. For 8-bit conversions, charge pump leakage is computed as follows:

$$V_{ERRJ} = .25\text{pF} \times V_{DDA} \times R_S \times \text{ATDCLK}/(8 \times \text{number of channels})$$
