

## **Looking for a Hardware Design and Embedded Programming Student**

We are looking for someone with a background in hardware design and embedded programming. We need them to develop multiple models of a hardware display that can be mounted on a surface and display images and video it receives over bluetooth from a phone app that we are developing. Some models will need to be weather proof and avoid glare. Over 4 months, we want to develop a multiple of these devices and specifications sufficient to be mass produced. This is a paid project which can be further spoken of in personal contact. Preferably someone with a background in mass producing hardware.
