What is the damping ratio, $\zeta$ ?
How do overdamped, critically damped, and underdamped circuits behave?

H (s) s goes to 0 goes to 1
$H(s)$ so goes to infinity goes to $0 \quad \frac{10^{12}}{\mathrm{~s}^{2}} \quad-40 \frac{\mathrm{db}}{\mathrm{dec}}$

At the limits you can start like a critically damped bode plot.
Critically damped $\omega 0=\omega c u t o f f$ (were the same)

$$
\text { At wo evaluate }\left|H\left(j \omega_{o}\right)\right| \quad \begin{aligned}
& \text { so our } H(s) \\
& \text { convert to } H(j \omega)
\end{aligned} \quad H(s)=\frac{1}{\frac{\frac{L C}{L C}}{s^{2}+\frac{R}{L} s+\frac{1}{L C}}}=\frac{\frac{1}{(j \omega)^{2}+2 \alpha \cdot j \omega+\frac{1}{L C}}}{21}
$$

$$
\text { remember } \quad \omega_{\mathrm{o}}^{2}=\frac{1}{\mathrm{LC}}
$$

$$
\frac{\omega_{\mathrm{o}}^{2}}{2}=\frac{\omega_{\mathrm{o}}^{2}}{} \quad \text { remember } \quad 0.5=\frac{\alpha}{\omega_{\mathrm{o}}} \quad \text { so } \quad \alpha=0.5 \omega_{\mathrm{o}}
$$

$$
-\omega_{\mathrm{o}}^{2}+2 \alpha j \omega_{\mathrm{o}}+\omega_{\mathrm{o}}^{2}{ }^{2}=\overline{2 \alpha \omega_{\mathrm{o}} \cdot \mathrm{j}}
$$

$$
\left|\mathrm{H}\left(\mathrm{j} \omega_{\mathrm{o}}\right)\right|=\frac{\omega_{\mathrm{o}}}{2 \times 0.5 \omega_{\mathrm{o}} \cdot \mathrm{j}}=\frac{1}{\mathrm{j}} \quad-\mathrm{j} \quad \sqrt{-1^{2}}
$$

$$
\left|\mathrm{H}\left(\mathrm{j} \omega_{\mathrm{o}}\right)\right|=1
$$

$$
20 \log \left(\left|\mathrm{H}\left(\mathrm{j} \omega_{\mathrm{o}}\right)\right|\right)=0 \mathrm{db} \quad \text { so we have a known point at wo and we ELIMINATED the }
$$ correction or gain loss so we have a better passband. It was -6dB

Damping ratio of 0.5 gives you a flat passband with a 40 db rolloff, better than cascaded first order filte b.) $\mathrm{H}(\mathrm{s})=\mathrm{VC}(\mathrm{s}) / \mathrm{V}(\mathrm{s})$ when $\mathrm{R}=1.41 \mathrm{k} \Omega$
$\mathrm{H}(\mathrm{s}) \mathrm{s}$ goes to 0 goes to 1 Still a low pass filter
$H(s)$ so goes to infinity goes to 0

$$
\begin{aligned}
\left|\mathrm{H}\left(\mathrm{j} \omega_{\mathrm{o}}\right)\right| & =\frac{1}{\sqrt{2}} \\
20 \log \left(\frac{1}{\sqrt{2}}\right) & =-3.01 \quad \mathrm{~dB}
\end{aligned}
$$

$$
\frac{\omega_{\mathrm{o}}^{2}}{-\omega_{\mathrm{o}}^{2}+2 \alpha j \omega_{\mathrm{o}}+\omega_{\mathrm{o}}^{2}}=\frac{\omega_{\mathrm{o}}^{2}}{2 \alpha \omega_{\mathrm{o}} \cdot j}
$$

So now this point is -3 dB at wo

$$
\begin{aligned}
& \text { now } \quad \alpha=\frac{1}{\sqrt{2}} \omega_{\mathrm{o}} \quad \frac{\omega_{\mathrm{o}}}{2 \cdot \frac{1}{\sqrt{2}} \omega_{\mathrm{oj}}} \\

## This is $\ll 1$ this is very

 underdampedH (s) s goes to 0 goes to 1
$\mathrm{H}(\mathrm{s})$ so goes to infinity goes to $0 \quad-40 \frac{\mathrm{db}}{\mathrm{dc}}$

$$
\begin{gathered}
\left|\mathrm{H}\left(\mathrm{j} \omega_{\mathrm{o}}\right)\right|=10 \\
20 \log (10)=20
\end{gathered}
$$

dB

So now this point is 20 dB at wo

$$
\text { now } \quad \alpha=0.05 \omega_{\mathrm{o}} \quad \frac{\omega_{\mathrm{o}}}{2 \cdot 0.05 \omega_{\mathrm{oj}}}=\frac{1}{0.1 \mathrm{j}}
$$

$$
2 \cdot 0.05=0.1
$$

This creates a peak, a large one and is not necessarily a good low pass filter

$$
-10 \mathrm{j} \quad \sqrt{(-10)^{2}}=10
$$ A flat passband is ideal remember.

Basic process summary for second order circuits:

Overdamped
Critically damped

Bode plots
Find real poles, regions, analyze

| Underdamped | Use critically damped approximation at the limits |
| :---: | :--- |
| Find correction at wo |  |
| $1>\zeta>0.5$ | Correction is a -db of some value |
| $\zeta=0.5$ | Correction is 0db <br> $\zeta<0.5$ |
| Correction is positive db (Strongly underdamped which means there is a <br> peak) |  |
